Position: Frontend Developer
Date: 1 September 2025

Introduction

Today, I worked on enhancing the user experience in the Aby HR Management System by improving the adding form used in the system. Previously, the form was long and required continuous scrolling, which made it less user-friendly and overwhelming. To solve this, I redesigned it into a multi-step form that breaks down the process into smaller, manageable sections. Alongside this improvement, I also fixed several UI issues to make the interface more consistent and visually appealing.

Key Tasks Completed

1. Converted Large Form into Multi-Step Form

- Split the original long form into logical steps (e.g., Personal Info, Job Details, Department, and Review).

- Designed a stepper navigation system to guide users through each stage of the form.
- Added Next and Previous controls for smooth navigation without losing entered data.
- Implemented form validation at each step to prevent incomplete submissions.
- Improved overall readability and accessibility, ensuring that users are not overwhelmed by too many fields at once.

2. Fixed UI Problems

- Corrected alignment and spacing issues across the form fields.
- Standardized button styles and ensured consistent use of colors and typography.
- Fixed responsiveness problems so the form now adjusts properly across devices (desktop, tablet, and mobile).
- Resolved overlapping elements and improved padding/margin for a cleaner look.

Summary

By redesigning the adding form into a multi-step format and fixing existing UI problems, the Aby HR Management System now provides a much smoother and professional user experience.

These improvements provide:

- Better usability with reduced scrolling and simpler navigation.
- Cleaner and consistent UI across all sections of the form.
- Higher completion rates since users can focus on one step at a time.
- Responsive design that works seamlessly on different devices.
